

Wilcoxon's rangsummetest

$U_i = W_i - \frac{n_i(n_i + 1)}{2}$, $i = 1, 2$, där W_i är respektive rangsumma.

Kritiska värden $U_{0.10}$

För stora värden på n_1 och n_2 gäller $U_\alpha \approx \frac{n_1 n_2}{2} - z_\alpha \sqrt{\frac{n_1 n_2 (n_1 + n_2 + 1)}{12}}$.

Här är $z_{0.1} = 1.645$, $z_{0.05} = 1.960$, $z_{0.02} = 2.326$, $z_{0.01} = 2.576$.

Hypotesen $m_1 \geq m_2$ förkastas om $U_1 \leq U_{2\alpha}$,

Hypotesen $m_1 \leq m_2$ förkastas om $U_2 \leq U_{2\alpha}$,

Hypotesen $m_1 = m_2$ förkastas om $U \leq U_\alpha$ (där U är det minsta av talen U_1 och U_2).
